## **Flyte** Production Grade Orchestration for Data and ML

Haytham Abuelfutuh Software Engineer Lyft

@HaythamAbuelfutuh in @HaythamAbuelfutuh @EngHabu

# Agenda

Motivation & Goal What problem are we trying to solve?

#### Flyte in ML lifecycle

Where Flyte fits in the ML Lifecycle

#### Architecture

A quick overview of the architecture

#### **DSL & Features**

Concepts, features and user interface

#### Demo

Everyone loves demos!

#### Conclusion

Learn more, get involved, & get started

#### **Motivation & Goal**

### ML & Data services are increasingly complex and interdependent

Data and ML processes often interact.

Data Flow is very complex and machine learning is more than just model code.

### Motivation & Goal It's not only all about ML Code

Source: Sculley et al: Hidden Technical Debt in Machine Learning Systems

## Flyte in ML lifecycle A typical ML Model Lifecycle

### Flyte in ML lifecycle Where Flyte fits in...

luA

### Flyte in ML lifecycle Production Grade Orchestration for Data & ML

Orchestrate ML & Data Workflows Collaborate, Reuse, and perform ML Ops Across Teams

Hosted, scalable and serverless Orchestration Platform

Fabric that connects disparate compute technologies

**Extensible, Observable & shareable** 

Integrates best of the breed open source solutions

Auditable, Repeatable & Secure

• Mapping

. . .

- Development
- Staging
- Production

### Tasks & Workflows

- Declarative (protobuf)
- Versioned
- Strongly typed interfaces
- Models the flow of Data
- Tasks
  - Arbitrarily complex
  - Encapsulate user code
- Workflows
  - Composable
  - Dynamic
  - o DSL

## Tasks

Atomic unit of work & entrypoint to user code. Language agnostic.

Can be executed independently.

```
case class SumTaskInput(a: Long, b: Long)
case class SumTaskOutput(c: Long)
class SumTask extends ... {
    override def
run(input:SumTaskInput):SumTaskOutput = {
      SumTaskOutput(input.a + input.b)
    }
}
```

https://github.com/spotify/flytekit-java

flytekit Scala

https://github.com/lyft/flytekit

```
Spark Code
@inputs(rides=Types.Schema[...], k=Types.Integer)
@outputs(dest=[Types.String])
@spark_task(spark_conf={"executors":2})
def find_topk_destinations(ctx, spark_ctx, rides,
k, dest):
  Find the top k destinations for the given set
of rides ordered by frequency
  1 1 1
                                 Arbitrary containers
edges = SdkRawContainerTask(
   input_data_dir="/inputs",
   output_data_dir="/outputs",
   inputs={"image": Types.Blob, "script": Types.Blob},
   outputs={"edges": Types.Blob},
   image="jjanzic/docker-python3-opencv",
   command=["python", "{{.inputs.script}}",
"/inputs/image", "/outputs/edges"],
```

# Concepts & Features Workflows

Specify the data dependency between tasks (as DAGs). **Composable** & **declarative**!

Multiple schedules for the same Workflow

```
Compose with other WF's
@workflow_class(cron=***)
class StaticSubWorkflowCaller(object):
    in = Input(Types.Integer, default=5,
    help="Input for inner workflow")
    identity_wf_execution =
IdentityWorkflow(a=outer_a)
    out =
Output(identity_wf_execution.outputs.task_o
utput, sdk_type=Types.Integer)
```

#### ML Model Train example @workflow class class TrainModel(object): # Accept inputs data = Input(Types.Schema[...]) hyperparam = Input(Types.Float) # Split the dataset split = split8020(data=data) model = fit\_xgboost( data=split.train, hyperparam=hyperparam) pred = eval\_xgboost(data=split.val, m=model.outputs.v) metrics = compute\_metrics( data=split.val, pred=pred.y\_pred) # Create outputs model = Output(model.outputs.v) accuracy = Output(metrics.outputs.acc)

## Dynamism

Flyte Workflows are **statically** defined and **immutable**. But, they can contain nodes - that can change the shape dynamically.

Data parallel jobs, dynamic generation of workflows (generate logic using the available data), etc.

### **Grouping & Sharing**

**Projects, Domains & Versions** 

- Projects offer **logical grouping** of Workflows & Tasks and can be split across one or more repositories, one or more containers
- Domains and Versions provide **CI/CD like semantics** to Workflows & Tasks
  - Users can **push new** versions to production, **rollback** to previous version etc.
  - Users can have workflows in **integration/staging** env
- Domains are **configured globally** for the system (by administrators)

#### Sharing & Accounting

- Workflows can refer to tasks and workflows from other projects
- Executions accounted/billed under the requesters project & domain (Infraspend)

### **Shareability: Flytekit Example**

Project: ProjectA @workflow class class PipelineA(object): in1 = Input(Types.Integer) in2 = Input(Types.Integer) out1 = Output(print2.outputs.out) Project: ProjectA @inputs(x=Types.Integer, y=Types.Integer) @outputs(z=Types.Integer) @task def my\_model(x, y):

```
Project: ProjectB
@workflow class
class CompositePipeline(object):
  composed_wf = lps.fetch(
          "ProjectA",
          "Production",
          "PipelineA",
          "1.0.2"
          )(in1, in2)
  t1 = local_task(composed_wf.outputs.out)
  t2 = tasks.fetch(
            "ProjectA",
            "Production",
            "my_model",
            "2.0.0"
            )(x=t1.outputs.x, y=10)
```

### **DataCatalog: Lineage & Memoization**

Every task execution in Flyte is **recorded** by default in Catalog Service. This enables Flyte executions to have,

#### **Artifact Lineage**

Causal dependencies between data and processes is tracked

#### Memoization

- Each task execution has a **unique signature**, which includes the input values & version of code
- **Repeated** executions with matching signatures are cached

### **Serverless**

User should only worry about business logic

- specify resource requirements CPU, GPU, Memory, #spark executors etc
- develop multiple versions of code concurrently
- Multi-tenancy unaware
- Simple gRPC/REST API to access all the power
- Language agnostic **flytekit** (python) and **flytekit-java**, raw containers
- Get **notifications** and **alerts** for specific events (failures, successes etc)
- **Retrieve results** of past executions

<pre>@python(gpu_hint=1, cpu=4,</pre>
retries=3, timeout=30s)
<pre>def myFunction():</pre>

## Concepts & Features Extensible

```
@sensor_task
def my_test_task(ctx):
    '''
    E.g. sensor that waits for a hive partition
    to land. This is added as a contrib.
    '''
    return MyHivePartitionSensor()
```

- Container executions are purely from Flyte's POV. (you can write in python, Java etc)
- But this is limited to the implementation SDK
- Backend extensions allow extending capabilities of Flyte.

#### Architecture

### **Architecture Overview**

Default: Single Kubernetes cluster with scale-out options to cloud services like AWS Batch.

te

#### Architecture

### **Real Production Scale**

8.5k Unique Workflows defined

54k Unique Task definitions

1million+ Workflow executions per month

10 million+ task executions per month

**40 million+** containers executed per month

Date

### Challenges

- Super-exponential growth, spiked 6x in 2 days
- Flyte had problems
  - Users lacked visibility
  - System admins were overwhelmed with operations
  - The cost expenditure ballooned
  - Various scaling problems
    - K8s control plane
    - etcD and K8s Controller
    - K8s Scheduler
    - FlytePropeller is complex (data handling)
- We started diving deeper and optimizing

#### #Workflows per week

## **Challenge: Scale**

- We observed problems with Single Kubernetes cluster -
  - API latency
  - Pod startup issues
  - etcD object size limits
- Single instance of
   FlytePropeller\* can run more than 2000 workflows concurrently
  - Informer caches
  - Smart control loop short circuits
  - Status compression
  - many more!

## **Challenge: Multi-tenancy**

- Flyte projects are multi-tenancy primitives. Some tenants have larger use-cases as compared to others
- Flyte leverages ResourceQuotas from Kubernetes
  - Flyte Cluster resource controller allows dynamic modification of limits
  - Observability tools show current utilization
  - FlytePropeller backs off intelligently to relieve KubeAPI pressure
- Flyte provides a custom Resource manager on top of Kubernetes Quotas that ensure Gobal limits and per tenant limits
  - These limits help maintain downstream service
  - Queues to maintain fairness (OSS in progress)
- K8s CRD FairQ (inprogress)

# Architecture & Challenges Challenge: Visibility

- Automatically generated user dashboard - grafana template (oss soon)
- Errors from execution pulled into the UI
- Logs from distributed tasks like
   Spark are pulled into the UI
- Users can triage amount of CPU/memory utilized by single execution
- User vs System errors are clearly separated

# Architecture & Challenges Challenge: Operations

- Standardized Grafana template for Admins (OSS soon)
- Improved documentation and examples (Work in progress)
- Staged rollouts
- FlyteAdmin provides a flexible routing system to multiple K8s clusters
- Allows **isolating** important usecases in different clusters
- Deployments **bake in lower priority** clusters before proceeding

Flyte System Overview ~			ආ දේ ම 🖶 O now-2h to now-1m × ව. ට 1m ×

## **Challenge: Efficiency**

- Centralized platform
  - Amortize **TCO**
  - Efficiency multiplier
  - Centralized tooling to visualize costs
- Utilize **Spot** instances (AWS only)
- Optimized Cluster Autoscaler (reduced spend by 25%)
- *Coming soon*: K8s scheduler optimizations

### Feature Highlights

• Hive, Presto,

#### Conclusion

### **Ecosystem**

# Conclusion What's Next

Flyte is constantly evolving and new features are coming soon like,

- Flytekit python Enhancement & Flytekit JAVA primetime ready
- Richer data catalog visualization
- **UI** improvements
- Reactive workflows (respond to data publication events)
- Better documentation and more examples
- Faster getting started

To find more details **visit our docs and the Roadmap section**. Also join our fledgeling community and help us shape the future of Flyte. We appreciate contributions and suggestions.

## Thanks! Learn more, get started & keep in touch at **Flyte.org**
