Artificial Intelligence—The Revolution Hasn't Happened Yet

by Michael I. Jordan

While the building blocks are in place, the principles for putting these blocks together are not, and so the blocks are currently being put together in ad-hoc ways. Thus, just as humans built buildings and bridges before there was civil engineering, humans are proceeding with the building of societal-scale, inference-and-decision-making systems that involve machines, humans, and the environment. Just as early buildings and bridges sometimes fell to the ground—in unforeseen ways and with tragic consequences—many of our early societal-scale inference-and-decision-making systems are already exposing serious conceptual flaws.

Artificial Intelligence—The Revolution Hasn't Happened Yet

by Michael I. Jordan

Unfortunately, we are not very good at anticipating what the next emerging serious flaw will be. What we're missing is an engineering discipline with principles of analysis and design.

What we have: recycled intelligence

→ “The success stories in language & vision processing came from scrupulously mimicking human intelligence. No new intelligence has been created; **existing human intelligence is merely recycled.**” -- David Donoho

A new discipline of engineering

Structural failure in civil engineering

1. Structure is not strong enough to support the load
2. Fatigue or corrosion
3. Manufacturing error or defective materials
4. Lack of consideration of unexpected problems

Structural failure: buckling

Structural failure in data science

1. Poor design (e.g. does not generalize as expected, not all users considered)
2. Lack of maintenance (e.g. model drift)
3. Failure due to bad parts (e.g. training data, assumptions, objective function)
4. Lack of consideration of unexpected problems (e.g. bad actors such as Cambridge Analytica)

- White spots around heart possible markers for Down Syndrome (risk 1 in 20)
- Amniocentesis could tell more (fatal 1 out of 300)
- White spots were white noise due to increased resolution of modern ultrasound

- Measure variable/outcome
- (Statistical) analysis
- (Attempt to) generalize
- Decision making

Apple Co-Founder Says Goldman's Apple Card Algorithm Discriminates

By [Shahien Nasiripour](#) and [Sridhar Natarajan](#)

- ▶ Steve Wozniak urges tougher regulation on credit algorithms
- ▶ Regulator opens probe after sexism was alleged in viral tweets

“These sorts of unfairnesses bother me and go against the principle of truth. We don’t have transparency on how these companies set these things up and operate,” Wozniak said in an interview on Sunday. “Our government isn’t strong enough on the issues of regulation. Consumers can only be represented by the government because the big corporations only represent themselves.”

Wozniak said he can borrow 10 times as much as his wife on their Apple Cards even though they share bank and other credit card accounts, and that other lenders treat them equally.

“Algos obviously have flaws,” Wozniak said. “A huge number of people would say, ‘We love our technology but we are no longer in control.’ I think that’s the case.”

Important, secretive, and harmful algorithms that impact

- Financial decisions
- Livelihood decisions
- Decisions around liberty
- Decisions around information

- The Value Added Model for teachers
- A widespread hiring model for minimum wage positions that had, embedded in it, a personality test that essentially performed a mental health assessment, which is illegal under the Americans with Disability Act
- Recidivism risk algorithms in the criminal justice system

- An attempt at automating the welfare eligibility system in Indiana;
- A predictive model that uses data in social services databases to determine whether or not children are at risk of abuse and/or neglect in Pennsylvania;
- An algorithm used in Los Angeles to determine who will get housing, out of the city's tens of thousands of homeless people

Those at highest risk

- had all types of personal data collected with little regard for security or privacy with minimal upside;
- were classified as “risky investments” and “problematic parents” by the relevant predictive models;
- Were targets of vast networks of surveillance.

YouTube's A.I. was divisive in the US presidential election

Guillaume Chaslot [Follow](#)

Nov 27, 2016 · 5 min read

YouTube's Artificial Intelligence (A.I.) recommends tens of billions of videos every single day, yielding billions of views. On the eve of the US Presidential Election, we gathered recommendation data on the two main candidates, and found that more than 80% of recommended videos were favorable to Trump, whether the initial query was "Trump" or "Clinton". A large proportion of these recommendations were divisive and fake news.

We propose two transparency metrics to elucidate the impact of A.I. on the propagation of political opinions and fake news.

Engineering information at a planetary scale

Circles are videos:

Links are recommendations:

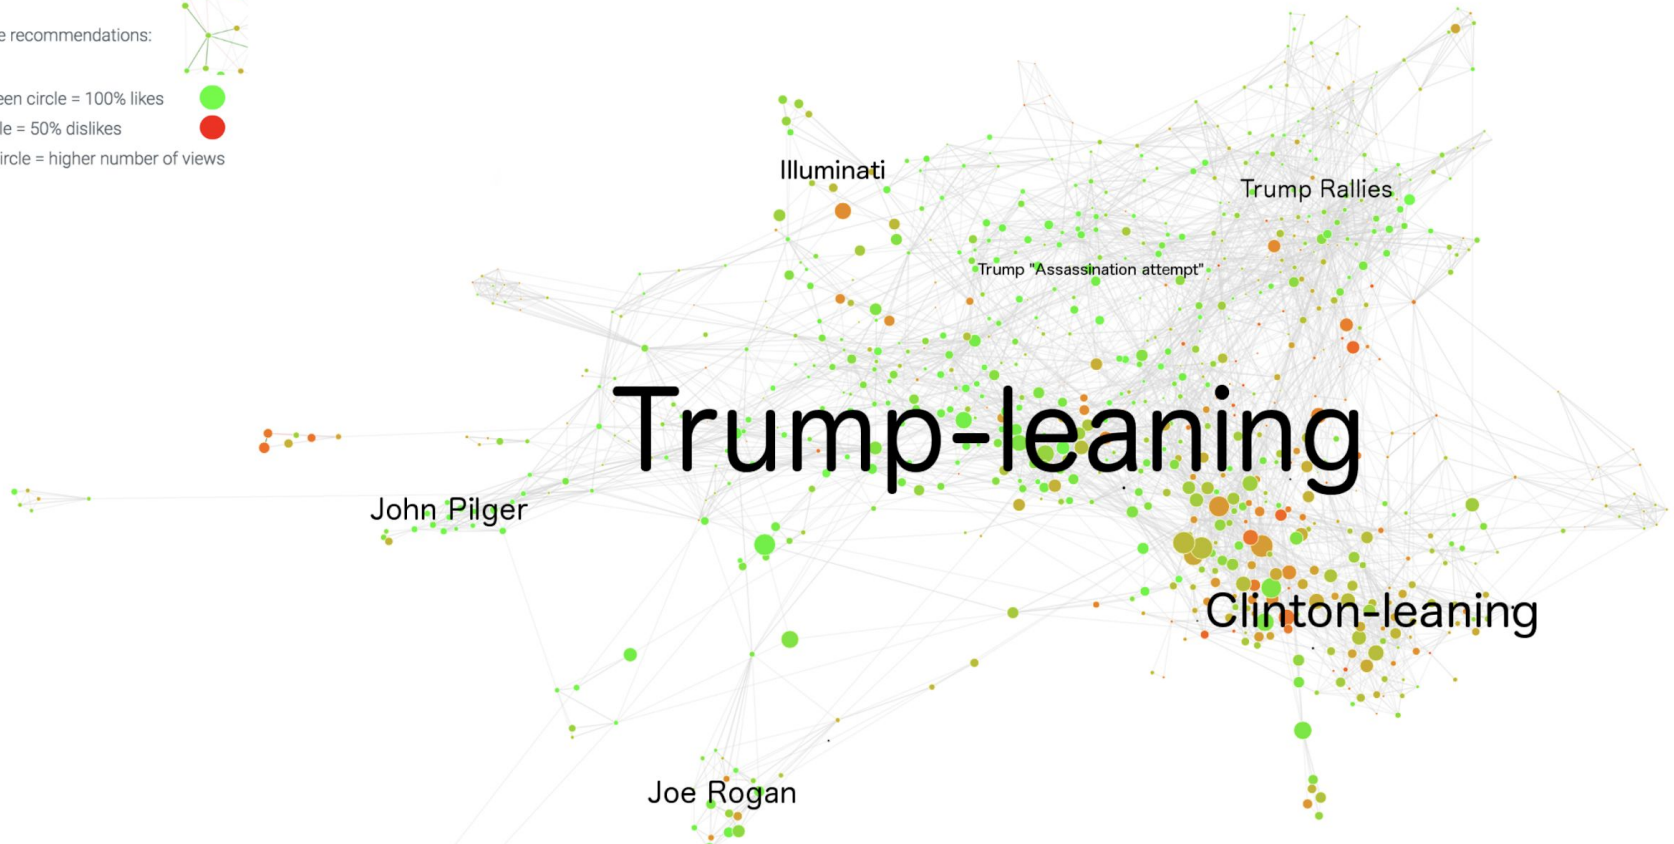

Light green circle = 100% likes

Red circle = 50% dislikes

Bigger circle = higher number of views

Searching from “is the earth flat or round?” and following recommendations five times, we find that **more than 90% of recommended videos state that the earth is flat.**

Alignment towards divisiveness

Maximizing engagement can create alignment towards values and behaviors that are particularly engaging for a small group of people at the cost of others, such as **racism, homophobia, sexism, xenophobia, bullying, religious hatred, violence, or conspiracies.** [Tay.ai](#), the Twitter chatbot from Microsoft, showed support for all of these, within 24 hours.

Filling the pipeline and holding “future” Black women programmers responsible for solving the problems of racist exclusion and misrepresentation in Silicon Valley or in biased product development is not the answer. Commercial search prioritizes results predicated on a variety of factors that are anything but objective or value-free. Indeed, there are infinite possibilities for other ways of designing access to knowledge and information, but the lack of attention to the kind of White and Asian male dominance that Guynn reported sidesteps those who are responsible for these companies' current technology designers and their troublesome products. There's a lot of huffing and puffing in ML/AI engineering, but most of it is about spinning up and wrangling unfriendly tools. You might write 10K lines of code in your project, but most of it is in service of coaxing those unwieldy tools into accepting your instructions. As the tools get better and better, you'll eventually see that there are only *two* real instructions in ML/AI:

1. Optimize this goal...
2. ...on this dataset.

@math_rachel

The problem with metrics is a big problem for AI

- Most AI approaches optimize metrics
- Any metric is just a proxy
- Metrics can, and will, be gamed
- Metrics overemphasize short-term concerns
- Online metrics are gathered in highly addictive environments

fast.ai/2019/09/24/met...

Flawed Algorithms Are Grading Millions of Students' Essays

Fooled by gibberish and highly susceptible to human bias, automated essay-scoring systems are being increasingly adopted, a Motherboard investigation has found

By **Todd Feathers**

Aug 20 2019, 9:00am  Share  Tweet  Snap

Optimization, objective functions & proxies

Goodhart's Law states that *"When a measure becomes a target, it ceases to be a good measure."* At their heart, what most current AI approaches do is to optimize metrics. The practice of optimizing metrics is not new nor unique to AI, yet AI can be particularly efficient (even *too* efficient!) at doing so.

This is important to understand, because any risks of optimizing metrics are heightened by AI. While metrics can be useful in their proper place, there are harms when they are unthinkingly applied. Some of the scariest instances of algorithms run amok (such as [Google's algorithm contributing to radicalizing people into white supremacy](#), [teachers being fired by an algorithm](#), or [essay grading software](#) that rewards sophisticated garbage) all result from over-emphasizing metrics. We have to understand this dynamic in order to understand the urgent risks we are facing due to misuse of AI.

Theory of the firm: Managerial behavior, agency costs and ownership structure

Michael C. Jensen, William H. Meckling *

The directors of such [joint-stock] companies, however, being the managers rather of other people's money than of their own, it cannot well be expected, that they should watch over it with the same anxious vigilance with which the partners in a private copartnery frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention to small matters as not for their master's honour, and very easily give themselves a dispensation from having it. Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs of such a company.

Computer Science Department, Stanford University, Stanford, CA 94305

products, or have something that is genuinely new. But we believe the issue of advertising causes enough mixed incentives that it is crucial to have a competitive search engine that is transparent and in the academic realm.

Section 230 of the Communications Decency Act

From Wikipedia, the free encyclopedia

Section 230 of the [Communications Decency Act](#) (CDA) of 1996 (a common name for Title V of the [Telecommunications Act of 1996](#)) is a landmark piece of [Internet](#) legislation in the United States, codified at [47 U.S.C. § 230](#). Section 230(c)(1) provides immunity from liability for providers and users of an "interactive computer service" who publish information provided by third-party users:

No provider or user of an interactive computer service shall be treated as the publisher or speaker of any information provided by another information content provider.

Hugo Bowne-Anderson @hugobowne · Aug 12
What does the solution space look like to you, Peter?

Peter Wang
@pwang

Replying to @hugobowne and @gchaslot

Longer term: overlay a new comms & information network on top of TCP/IP, HTTP.

Short term: Revoke CDA 230 protection for any content that a user did not explicitly ask for, search for, navigate to. Anything "promoted", "recommended", etc. - the platform is responsible for.

6:35 PM · Aug 12, 2019 · [Twitter Web App](#)

✓ **Peter Wang** @pwang · Aug 12 ✓

Replying to @pwang @hugobowne and @gchaslot

Basically, tie accountability to financial incentives. If you make money promoting eyeball-minutes of attention capture on your platform, you're accountable for the content that you're monetizing. Fin.

CC @tristanharris

✓ **Peter Wang** @pwang · Aug 12 ✓

This gives the social content platforms like Youtube a way to still surface a broad amount of content from *validated* users; and takes away the free pass their Algorithm has enjoyed for the last decade, at the cost of social health of most industrialized nations.

AI Now Report 2018

7. **Technology companies must go beyond the “pipeline model” and commit to addressing the practices of exclusion and discrimination in their workplaces.** Technology companies and the AI field as a whole have focused on the “pipeline model,” looking to train and hire more diverse employees. While this is important, it overlooks what happens once people are hired into workplaces that exclude, harass, or systemically undervalue people on the basis of gender, race, sexuality, or disability. Companies need to examine the deeper issues in their workplaces, and the relationship between exclusionary cultures and the products they build, which can produce tools that perpetuate bias and discrimination. This change in focus needs to be accompanied by practical action, including a commitment to end pay and opportunity inequity, along with transparency measures about hiring and retention.
